

Whitepaper v1.0 · September 2026

ARCDEX: the social trading layer for Arc

One fast, safe and social place to find, trade and launch every meme coin on Arc — with self-custody, USDC for everything, and fees that buy back and burn \$ARCD.

1 Abstract

ARCDEx is the social trading app for Arc, Circle's stablecoin-native Layer 1. It brings the meme coins launching on Arc into one place: a live terminal across launchpads, one-tap trading from a wallet the user controls, real-time trader activity, a fair-launch launchpad and rewards paid in USDC.

Its official coin, \$ARCD, has a fixed supply of 1,000,000,000 and no mint function. The fees ARCDEx keeps are used to buy \$ARCD back on the open market and burn it.

This paper covers four things: the market ARCDEx is built for, what meme traders need, what ARCDEx already does, and a roadmap that ships a new phase every 5–7 days, starting 28 September 2026.

2 The opportunity: Arc's meme market

Arc opened its public mainnet on 16 September 2026. Gas is paid in USDC, blocks land about every half second, and USDC arrives from other chains through Circle's CCTP. Meme traders came on day one:

\$410.8M

DEX volume on day one

82%

of it on meme-coin launchpads

97,025

new tokens in 24 hours

19

launchpads competing

The largest launchpad, Argus, handled \$202 million and 86% of new tokens.

The other side showed just as fast. Among early buyers with enough data, 58.7% sold within 15 minutes, and the median holding time was 79 seconds. Many early coins rose 5–10× and then gave back 75–90%.

Arc has real demand for meme trading. But it is spread across launchpads, it is fast, and it is unforgiving. Traders will choose the platform that helps them find good coins faster, trade them more safely and earn more by staying — whichever launchpad a coin comes from.

3

The problem

- **Scattered.** Coins launch on 19 launchpads. Traders juggle tabs, wallets and bots.
- **Fast, but not safe.** Bundled launches, snipers and developers selling are hard to spot when positions last 79 seconds.
- **Costly.** Every extra fee adds up when positions turn over in minutes.
- **Lonely.** Most tools show charts, not people. Traders want to see who is buying and follow those who win.
- **Hard to start.** A first trade usually needs an exchange account, a gas token and a bridge.

4

What meme traders want

We studied the leading meme-trading apps and launchpads on Solana, Base and BNB Chain, and those on Arc. The platforms traders stay with share eight traits:

1. Low fees, paid back

Terminals charge about 1% and return part of it as cashback by volume tier.

2. New coins first, with red flags

Live boards of new, graduating and graduated coins, filtered by dev holdings, snipers and bundles.

3. Follow the winners

Wallet tracking, public profit and win rates, alerts, and one-tap copying.

4. Trade without watching charts

Limit orders, take-profit, stop-loss and auto-sell.

5. Get paid to create and hold

Creator fee shares, cashback coins that pay traders, holder rewards, referral income.

6. Mobile first, easy money in

One balance, no gas token, card and local payment methods. The fastest-growing social app funded 68,000 first-time buyers through Apple Pay.

7. Culture

Chat, launches from social media and shareable wins.

8. Everything in one app

Spot trading today; perpetual futures are joining the same apps.

ARCDEX today

ARCDEX is live on Arc mainnet at arcdex.online.

- **Terminal.** Every Arc coin in one live list, with a 0–100 risk score and a green or red flash on every buy and sell as it lands on-chain.
- **Charts.** Live ARCDEX charts where each trade pops onto the chart, plus GeckoTerminal charts.
- **Launchpad.** Fair bonding-curve launches:
 - 1,000,000,000 fixed supply: 95% into the curve, 5% to the platform.
 - A \$3 launch fee, and graduation at \$25,000 raised.
 - Anti-snipe limits: \$2,000 per buy for the first 10 minutes, and \$5,000 per block.
 - Creators earn 60% of their creator tax (up to 3%) in USDC, on every trade.
- **Trading wallet.** A wallet in the browser that only the user controls. It is protected by a passcode and an optional passkey, and buys and sells in one tap. Sending funds to a new address needs the passcode.
- **Social.** A live feed, follows, trader profiles with profit and loss, leaderboards, clans and trade theses.
- **Rewards.** Referrers earn 15% of the fees their friends pay, on-chain, in the same transaction. ARCDEX Points too.
- **Money in and out.** USDC on Arc, Circle CCTP bridging from other chains, and card, Apple Pay or Google Pay through Circle.
- **Safety.** Coin pages show developer holdings, top-holder share, creator tax, honeypot flags and a launch-bundle check.
- **Languages.** English, Français, Español, Português, Kiswahili, Deutsch and 中文.

Strategy: four pillars

ARCDEX is not another launchpad. It is the trading layer for all of them.

1. Price

The lowest total cost to trade Arc memes: a 1% swap fee with cashback in USDC.

2. Discovery and safety

Every new coin on Arc first, with its red flags on screen before the first buy.

3. Social

Follow, copy and compete with the best traders. Every win is shareable.

4. Access

Mobile first, local money and local languages. We start with East Africa, where mobile money and stablecoins already meet.

East Africa is a natural first market. Stablecoins make up about 43% of crypto transactions in Sub-Saharan Africa. Kenya ranks among the world's leaders in everyday stablecoin use, and mobile money wallets can already link to crypto accounts.

Roadmap: a new phase every week

Seven phases, each shipped in 5–7 days, starting 28 September 2026.

Phase 0 Live now

Live on arcdex.online

- Terminal for every Arc coin, with live trade flashes and risk scores
- Fair-launch launchpad with anti-snipe limits; creators earn 60% of their tax
- One-tap trading wallet with passkey, portfolio and safe withdrawals
- Feed, follows, leaderboards, clans and 15% on-chain referral rewards
- USDC deposits, Circle CCTP bridge, card and Apple Pay; 7 languages
- \$ARCD buyback and burn from platform fees

Phase 1

28 Sept – 4 Oct • 5–7 days

Fair fees

- Swap fee cut from 2% to 1%
- USDC cashback on every trade, 5–25% of the fee by 30-day volume
- Automatic profit cards with your invite link

Phase 2

5 Oct – 11 Oct • 5–7 days

Trenches

- Live board of every Arc launchpad: New, About to graduate, Graduated
- Safety filters: dev holdings, snipers, bundles, top-10 share, holders
- Saved presets, one-tap buys and an AI coin finder in plain words

Phase 3

12 Oct – 18 Oct • 5–7 days

Follow the winners

- Follow any wallet and get an alert on every buy and sell
- Copy any trade in one tap
- Installable app with push notifications

Phase 4

19 Oct – 25 Oct • 5–7 days

Smart orders

- Limit, take-profit, stop-loss and trailing-stop orders
- Auto-sell ladders and DCA
- Orders run from your own wallet: no custody

Phase 5

26 Oct – 1 Nov • 5–7 days

Community

- Telegram bot for alerts, quick buys and launches
- Launch a coin by posting on X †
- Live chat on every coin
- Seasons: points become fee discounts and cashback boosts; clan wars

Phase 6

2 Nov – 8 Nov • 5–7 days

Launchpad v2 and ARCD EX Verified

- Creators choose where fees go: to themselves, traders or holders †
- ARCD EX Verified: bundle and linked-wallet screening before a coin is listed
- Public safety-score API

Phase 7

9 Nov – 15 Nov • 5–7 days

Access and more markets

- Mobile money in and out: M-Pesa, Airtel Money, Mixx by Yas, MTN MoMo †
- Always-on orders and auto-copy with capped session keys †
- Perpetual futures †
- Responsible-trading tools: loss limits and cool-downs

† Built in the phase; goes live once a partner, an independent audit or a regulator allows it. Dates are targets and may move; progress is reported every week.

Name / symbol	ARCDDEX · ARCD
Network	Arc mainnet
Contract	0x4b93446882d29e094181b2fa e14b126577a2676c
Total supply	1,000,000,000 — no mint function
Launched on	Argus (Portal 8)
Pool	ARCD / USDC · Uniswap v4 · 0x8 7b6...9897
Fee wallet	0x274262a0321a0701b0a46a35 76e07ae881c286bb
Burn address	0x000000000000000000000000 000000000000dEaD

Swaps, launchpad trades and bridges pay a small fee in USDC.

Anyone can watch the fee wallet on-chain.

The fee wallet buys \$ARCD on the open market.

Bought \$ARCD goes to the burn address. No one can ever move it, so the supply only goes down.

Fees today

SOURCE	FEE	WHERE IT GOES
Swaps on ARCDEX	2% of each trade, in USDC	85% to buyback and burn; 15% to the trader's referrer
Launchpad trades	1% platform fee + the coin's creator tax (0–3%)	The 1% and 40% of the tax to buyback and burn; 60% of the tax to the creator
Bridge (Circle CCTP)	0.5% (min \$0.05, max \$50)	90% to buyback and burn; Circle keeps 10%

From Phase 1

The swap fee drops from 2% to 1%. Traders get 5–25% of the fee back as USDC cashback, depending on their 30-day volume. Referrers keep earning 15%.

Cashback and referral rewards are paid first, and everything the platform keeps still buys back and burns \$ARCD. The on-chain router caps the swap fee at 2%, so it can never be raised above that.

\$ARCD is a community coin. Burning reduces supply but does not promise any price, value or profit.

Security and trust

- **Self-custody.** Keys stay in the user's browser, protected by a passcode and an optional passkey. ARCDEx never holds user funds.
- **Rules in the contracts.** The swap router caps its fee at 2% and pays referral rewards inside the same transaction. It holds no funds after a swap. The launchpad enforces its anti-snipe limits on-chain.
- **Automation with limits.** Phase 4 orders run from the user's own wallet. The always-on orders and auto-copy of Phase 7 use session keys that can only trade through the ARCDEx router. Each key has per-trade and daily caps and an expiry, can be revoked in one tap, and can never withdraw.
- **Reviewed before launch.** New contracts, such as session keys and Launchpad v2, go live only after an independent security review.
- **Open books.** The fee wallet, buybacks and burns are public on-chain, and the burn dashboard shows them live.

Regulation and responsible trading

- **Licensed partners for money in and out.** Card and mobile-money on-ramps run through licensed partners that handle identity checks (KYC) and anti-money-laundering (AML) controls.
- **Market by market.** Features launch where they are permitted. That includes Kenya's Virtual Asset Service Providers Act (2025) and its 2026 regulations, and the framework the Bank of Tanzania is preparing.
- **Responsible-trading tools.** Daily loss limits and cool-downs arrive in Phase 7. ARCDEx shows risk scores on every coin before anyone trades it.

What we will report

Every week we will publish, on the site and on X:

- trading volume and fees;
- cashback and referral rewards paid;
- \$ARCD bought back and burned;
- active traders;
- progress on the current roadmap phase.

This document describes ARCDEX and its plans. It is not an offer to sell or a solicitation to buy any asset, and it is not financial, legal or tax advice. Meme coins are highly volatile and most lose value: only trade what you can afford to lose. \$ARCD has no promise of value or profit. Roadmap items, dates and fees may change. Items marked † depend on partners, audits or regulators. ARCDEX is non-custodial software; users control their wallets and funds, and are responsible for complying with the laws where they live.
